

O'RUME DOMINIC URIRIE

AI Engineer · Agentic AI Assurance | LLM & RAG systems, verifiable accountability, measurement instrumentation

CONTACT

orumedominic@gmail.com
+44 7402 830944
rumedominic.com
linkedin.com/in/dominicrume
github.com/dominicrume
Birmingham, UK

SKILLS

Languages & Frameworks

Python, TypeScript / JavaScript,
SQL, FastAPI, Flask, Next.js, React

AI & Agentic Systems

LLM orchestration, RAG pipelines,
agent tool-use and planning, human-
in-the-loop control, LangChain,
LangGraph, CrewAI, LLM evaluation

Machine Learning & Research Method

scikit-learn, PyTorch, classification
and forecasting, pre-registered
experimental design, blinded
analysis, inter-rater reliability
(Cohen's κ), ANOVA

Cloud, Delivery & Data

Docker, GitHub Actions, GitLab CI,
Google Cloud Run, Vercel, Fly.io,
AWS, Supabase, PyPI packaging,
automated testing

Verification & Governance

SHA-256 audit chains, on-chain
anchoring (Polygon), Daml smart
contracts, STRIDE threat modelling,
RBAC, secrets management

CERTIFICATIONS

Microsoft Azure AI Apps & Agents
Developer
Certified Blockchain Architect,
Blockchain Council
Cisco CCNA & CCNP
AI Governance & Responsible AI
Python, University of Michigan

PROFILE

AI engineer working where agentic systems meet assurance. I build the instrumentation that answers a question conventional benchmarks do not ask: not whether generated code runs, but whether the agent built the thing it was asked to build. My MSc instrument is open source, pre-registered and published with its own errata; the companion ledger work is catalogued in the Canton Network's official developer hub. Alongside the research I ship production systems (LLM and RAG services, document-verification layers and multi-tenant SaaS), and have taught the underlying material free, since 2017.

PROFESSIONAL EXPERIENCE

MCKI Solutions

AI Engineer, Enterprise Applications

November 2025 – Present · Birmingham, UK

Delivers enterprise AI applications end to end, covering requirements gathering, build, testing, deployment, documentation and user training, moving LLM prototypes into client-facing, cloud-hosted tools across student routing, document processing, content automation and housing operations.

Built an AI student gateway mapping applicant preferences to universities and visa pathways, an OCR and RAG pipeline that extracts transactions and classifies tax categories for compliance review, and a governed publishing engine for controlled multi-channel release. Owns cloud deployment, performance budgets and the CI gates changes must pass.

VOREM · VOREM Institute of Technology

Founder, AI / ML Engineer and Technical Lead

September 2017 – October 2025

Built and operated AI products across education, analytics and workflow automation through two eras of the field: classical ML pipelines and predictive modelling from 2017, then LLM and agentic systems from 2023. Work included a supervised-autonomy quantitative signal system with a governance kill-switch and production monitoring.

Founded and ran the institute's free technical programme, which has **2,900+ registered learners and has reached over 12,000 people**, with scholarships across Nigeria, Zimbabwe, Rwanda and Uganda. Supervised project work spanning development, testing, prompt engineering and API integration.

Simera Global

AI Advisor (advisory engagement)

February 2026 – Present · London, UK

Advises on AI workflow design for cross-border business pipelines: CrewAI and LangGraph orchestration, verification layers, and secure data handling for autonomous-agent use cases.

Okedom Global Services Ltd

Business Development Manager

August 2015 – August 2017

Led business development, sales operations and technical support in consumer technology.

EDUCATION

Aston University: MSc Artificial Intelligence & Business Strategy

2026 · Birmingham, UK

Dissertation: *Measuring the Unmeasured*, a pre-registered, blinded instrument for auditing the code-quality and governance behaviour of agentic AI coding workflows. Aligned to the Aston-Capgemini Centre of Excellence for Enterprise AI.

Covenant University: BEng Electrical & Electronic Engineering

Final project: a 5 kVA intelligent changeover inverter. Industrial internship at a 1,020 MW thermal power plant.

SELECTED PROJECTS

AI Code Quality Auditor: open-source measurement instrument

Python · published on PyPI · github.com/dominicrume/ai-code-quality-auditor

An empirical safety harness for agentic AI coding systems. It scores five metrics (security-vulnerability density, cyclomatic complexity, duplication, specification hallucination and correction frequency) across five workflow conditions against fixed specifications, with the analysers blinded by interface design rather than by discipline. Published on PyPI with **over 3,600 downloads**, shipped as a reusable GitHub Action with a CI gate and JSON decision record, and served by a live public dashboard. The instrument is pointed at its own source and the warnings it raises are published rather than tuned away.

Know Your AgenticAI: spend mandates and hash-chained receipts on Canton

Daml · Python · catalogued in the official Canton Developer Hub

Enforces an AI agent's spending mandate inside a Daml choice body (cap, per-period limit, allow-list, expiry, revocation) and seals every attempt into a hash-chained receipt, *including the ones the ledger refused*, so refusals reach an auditor without exposing the accepted payments behind them. **Three pull requests merged by the Canton Foundation's developer-relations team**; catalogued as a partner tool in the AI Tools category.

Tenant Hub: B2B housing-operations SaaS

Next.js · Supabase · MCKI Solutions · live April 2026

Multi-tenant housing-management platform serving 100+ tenants, with role-based access control, brand-level data separation, SHA-256 audit-chain records and CI-enforced deployment controls.

VeritaPort: Layer-3 document verification

FastAPI · Next.js · Docker · Polygon · client engagement

A cryptographic verification layer for tamper-evident document integrity: SHA-256 hash-chain verification, on-chain audit anchoring and product-level tamper detection.

Eagles Den: subscriber analytics platform

Python · Google Cloud Run · VOREM

A five-model LLM analytics workflow for subscriber decision-making, with billing integration and multi-channel delivery.

RESEARCH, IP & RECOGNITION

- **UK patent application GB2611754.9** (filed May 2026, pending) for the KYA framework for verifiable AI accountability and provenance.
- **ACM Europe Seasonal School on Responsible AI**, Aston University, September 2026. Selected through a scored international application round that invited only the top 30–50 candidates. My team was **awarded second prize** in the school's project competition, for human-in-the-loop decision support in regulated markets.
- **FrontierTechX**, University of Birmingham, March 2026. Panellist, "Agentic AI: From Copilots to Autonomous Enterprises". Also hosted and spoke at two further Birmingham technology events in 2026.
- **MSc dissertation** validated by two independent raters (Cohen's $\kappa = 0.870$ rater-to-rater), with the erratum that overturned one of its own cleanest findings published rather than quietly corrected.
- **Author of five books** on AI and blockchain, listed and orderable through Waterstones and Amazon. Foreword to *From Code to Consciousness* by Olusola Amusan, co-founder of Vesti.
